- (a) Iodine is absorbed by thyroid gland
- (b) Phosphorus and strontium are absorbed by bones
- (c) Cobalt is absorbed by liver
- (d) All of these
- 46. The SI unit of absorbed dose is:
- (b) Gray (a) Joule 47. The activity or rate of decay of a radioactive source is measured in terms of:

  - (a) Becquerel (b) Ohm (d) Coulomb
- (c) Faraday

- 48. Which of the following is true about radioactive radiations? (a) They posses ionization power (b) They can damage cells of living tissues
  - - (d) All of these

(c) Rem (d) Rad

- (c) They can penetrate in the body
- 49. Which two nuclei contain the same number of protons?
  - (b)  $^{23}_{11}Na$  and  $^{24}_{12}Mg$  (c)  $^{16}_{7}N$  and  $^{15}_{8}N$
- (d)  ${}_{14}^{32}Si$  and  ${}_{15}^{32}P$
- (a)  ${}^{12}C$  and  ${}^{14}C$ 50. The product of half-life and decay constant for any radioactive element is always:

- (d) One

| (a) Co |     | (b) 1.4 | istant for any | (c) Zero | (d  | ) One                 |

## PRACTICE TEST NO. 5

- 1. In the heavy elements of periodic table, the number of protons are ___ than/to the number of neutrons:
- (c) Greater
- (d) Almost zero
- 2. A radioactive nuclide decays by emitting by alpha particle, a beta particle and a gamma ray photon the change in the nucleon number is:
  - (a) 4
- (b) -2

- 3.  $\beta$ -particle from various radioactive resources all have same (d) The same energy (a) The same mass (b) The same speed (c) The

- deflection
- 4. In 420 days, the activity of a sample of polonium (Po) fell to ath of its initial value. The half-life of
  - polonium is:
- (b) 70 days
- (c) 280 days
- (d) 210 days

- 5. A nuclide  $\frac{208}{82}$ X decay to a new nucleus Y by one  $\beta^+$ -emission and three  $\gamma$ -emissions, the nuclide
  - Y is:
    - (a) 208_V
- (b) 210 v
- (c) 208 y

- 6. Decay of one radioactive nucleus per second is equal to:
- (b) One half life
- (c) One Becquerel (d) One henry

- (c) γ-emission (d) Position emission
- 7. In which radioactive disintegration, neutron dissociates into proton and electron: (a) He⁺⁺ emission (b)  $\beta$ - emission 8. The half life of radon is 3.8 days. Three forth of a random sample decay in:

- (d) 11.4 dyas
- (b) 15.2 days (a) 5.02 days

NUCLEAR PHYSICS 9. Which of the following statement(s) is /are correct?

- (a) Heavy nuclei have more number of protons than neutrons
- (b) Heavy nuclei have more number of neutrons than protons
- (c) Heavy nuclei are likely to undergo fission than fusion
- (d) Both B and C
- 10. In 88 Ra 226 Nucleus, there are:
  - (a) 128 protons and 88 neutrons
- (b) 138 neutrons and 88 protons
- (c) 226 protons and 88 electrons
  - (d) 226 neutrons and 138 electrons

11. 1 rem =

UNIT 13

- (a) 1 Sv
- (b) 0.001 Sv
- (c) 0.1 Sv
- do seltunidoso e el morad and Al (d) 0.01 Sv

- 12. Most of the cobalt is absorbed by:

- (a) Bones (b) Liver (c) Skin (d) Thyroid gland 13. In the disintegration series  $\begin{array}{c} 238 \\ 92 \end{array} \stackrel{\alpha}{\cup} \stackrel{\beta}{\to} \stackrel{A}{\times} \stackrel{A}{\to} \stackrel{A$
- (b) 88, 230 (c) 90, 234 (d) 91, 234 14. The half - life of 234Th 90 is 24 days. If 8 kilogram of this isotope is present initially, what amount
- (a) 2 kg (b) 1 kg 15. The radioactive nuclide decays by emission of four  $\alpha$ -particle. The nuclide  $X_{92}^{236}$  finally formed is: (c) 5 kg (d) 4 kg
- (a)  $_{84}X^{220}$  (b)  $_{62}X^{218}$  (c)  $_{81}X^{212}$ 16. How many types of subatomic particles are present in nucleus?
- (b) 2 17. Decay constant λ is given by:
- (c) 4 (d) 5
- 18. The percentage of the original quantity of a radioactive material left after five half lives is
  - (c)  $-N\Delta N\Delta t$

(d) 20 %

(d) 2 hours

- (b) 5% (c) 3% 19. If  $\frac{15}{16}$  of radioactive atoms decays in 16 hours, the half-life of element is:
- (a) 16 hours (b) 8 hours (c) 4 hours
- 20. The half life of an element is 160 days. What fraction of it will be left in 80 days?
- 21. The amount of charge present on strange quark is:
  - (a)  $-\frac{1}{2}e$  (b)  $+\frac{1}{2}e$

(a) 1%

- 22. How much of the mass of an atom is concentrated in the nucleus? (b) 99% (c) 100%
- 23. What is the respective number of  $\alpha$  and  $\beta$  particles emitted in the following radioactive decay (a) 6 and 8
- (b) 8 and 8
- - (c) 6 and 6
- 24. A given radioactive sample is reduced from 20 g to 1.25 g in 40 days. Its half life would be:
- (b) 8 days 25. Which one has the highest penetrating power? (a) Alpha rays
  - (b) Gamma rays
- (c) 5 days
- (d) None of these
- (c) Beta Rays 26. The half-life of an element is 160 days. What amount of it will be left in 80 days? (d) Neutron (c) 1

A radioactive material has an initial amount 32 g. After 60 days it reduces to 2 g, then the half-                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 47. One microgram of matter converted into energy will give:<br>(a) $90.1 \times 10^{10} \text{ J}$ (b) $9 \times 10^{3} \text{ J}$ (c) $9 \times 10^{7} \text{ J}$ (d) $9 \times 10^{5} \text{ J}$ ## 22. The half life of radon gas is:

- (b) 3.8 days (a) 23.5 min
- (c) 4500 years (d) 1620 years
- 23. 280 days old radioactive sample has activity 6000 dps (disintegration per second). After 140 days activity decreases to 3000 dps. The initial activity in dps was: (a) 24000 (b) 12000 (c) 16000 (d) 9000

- 24.  $\alpha$ .  $\beta$  and  $\gamma$  rays emitted by a radioactive substance are passed through a region containing a magnetic field at right angles to their path. The energy gained will be:
  - (a) Maximum for α-rays

- (b) Maximum for y-rays
- (d) Zero for all of them
- (c) Minimum for β-rays 25. A 75 kg person receives a whole body radiation dose of 24 m-rad, delivered by α-particles for which RBE factor is 12. The equivalent dose in rem is:
  - (a) 0.29
- (b) 0.97 (c) 0.50 (d) 0.65
- 26. How much energy is absorbed by a man of mass 80 kg who receives a lethal whole body equivalent dose of 400 rem in the form of low energy neutrons for which RBE factor is 10? (b) 54 J (c) 40 J (d) 48 J
  - (a) 32 J

- 27. The damage from α-particles is unless the source :
  - (a) Large, enters the body
- (b) Small, enters the legs
  - (c) Small, enters the body

- (d) Large, enter the arms
- 28. If RBE factor = 10, De = 400 rem, absorbed dose D = ?
  - (a) 0.2 Gy
- (b) 0.04 Gy (c) 0.02 Gy (d) 0.4 Gy
- 29. The activity of a radioactive isotope decreases from 8000 to 1000 in 60 years. The half life of isotope will be
  - (a) 10 year
- (b) 20 years
- (c) 30 years
- (d) 40 years
- 30. Find the probability that the nucleus of 57Ra221 undergoes decay after three half-lives, if it's a radioactive substance which has a half-life of 6 days.
  - (a) 1/6
- (b) 3/2
- (c) 7/8
- 31. The electron emitted in  $\beta$  radiation originates from where?
  - (a) Inner orbits of atom
  - (b) Free electrons existing in nuclei
  - (c) The decay of a neutron in a nuclei
  - (d) Photon escaping from a nuclei
- 32. Which rays need medium to travel
- (a) X-rays (d) No radiation need medium to travel
- (c) Gamma rays

- 33. Which rays cannot be produced by electronic transitions? (b) Beta (c) Gamma (d) All of these
- (a) Alpha
- (a) way of oxeds broughten col.

- 34. Average life in terms of decay constant is:

  - (a)  $1/\lambda$  (b)  $\lambda^2$
- (c) 2\(\lambda\) (d) 2/\(\lambda\)
- 35. A Uranium isotope  ${}^{232}_{92}$ U undergoes one  $\alpha$ -decay and one  ${}^{0}_{-1}\beta$ -decay. What is the final atomic number? (c) 89 (d) 91

  - (a) 90
- (b) 92

- 36. Emission of radiation from radioactive substance is:
  - (a) Dependent on both temperature and (b) Independent of temperature but dependent
    - on pressure
  - (c) Independent for both temperature and (d) Independent of pressure but dependent on pressure
    - temperature
- 37. Which one of the following isotopes of lodine is used for the treatment of thyroid cancer?

**UNIT 13** 

pressure

- (a) I-113 (b) I-120
- (c) 1-131
- (d) I-140
- 38. A beta ( $\beta$ ) particle is a fast-moving electron. During a  $\beta$  decay how the atomic number and mass number of a nucleus change?

| Atomic Number    | Mass Number                                       |
|------------------|---------------------------------------------------|
| Remains the same | Increase by one                                   |
| Increase by one  | Decreases by two                                  |
| Increases by one | Remains the same                                  |
| Decreases by two | Decreases by four                                 |
|                  | Remains the same Increase by one Increases by one |

- 39. A naturally occurring radioactive element decays two alpha particles. Which one of the following represents status of daughter element with respect to mass number 'A' and charge number 'Z'?

  - (a) 'Z' decreases by 4 and 'A' decrease by 2 (b) 'Z' decrease by 2 and 'A' decreases by 4
- (c) 'Z' decreases by 4 and 'A' decreases by 8 (d) 'Z' decreases by 8 and 'A' decreases by 4 40. A radioactive isotope 'W' decays to 'X' which decays to 'Y' and 'Y' decays to 'Z' as represented by the figure below:

What is the change in the atomic number from 'W' to 'Z'?

- . (a) Increased by 3

- (b) Increases by 5 (c) Decreases by 3 (d) Decreases by 5 41. Three paths of radioactive radiations are observed as shown in the figure in the presence of electric field. Which type of radiation in shown in path 1?

- (a) Alpha
- (b) Beta
- (c) Gamma
- (d) Cathode rays
- 42. What is the absorbed dose 'D' of a sample of 2 kg which is given an amount of 100 J of
  - (a) 200 Gy

(a) α-particle

- (b) 102 Gy
- (c) 50 Gy
- (d) 98 Gy
- 43. In the reaction,  $\begin{array}{c} 234\\92\\ \end{array}$  Th  $\rightarrow \begin{array}{c} 234\\91\\ \end{array}$  Y +  $\begin{array}{c} 0\\-1\\ \end{array}$  e the electron  $\begin{array}{c} 0\\-1\\ \end{array}$  e-emits from the:
- (b) 2nd orbit
- (c) Nucleus
- (d) Valence Shell 44. According to the equation  ${}^{A}_{\tau}X \rightarrow Y+3\alpha$  particles, what are the atomic and mass number of 'Y'?
- (a) Z-6, A-1245. Cobalt 60 is used in medicine and is an intense source of:
  - (b) Z-2, A-4
- (c) Z+1, A
- (d) Z + 3. A

- 46. Sodium 24 has half-life of 15 hour and it is used in medicine to estimate:
  - (a) Kidney Function (c) Iron in Plasma

- (b) Plasma Blood Volume
- (d) Thyroid Function

- 47. Wavelength of y-rays is:
  - (a) Equal to the X-rays

(b) Shorter to the X-rays (d) Boarder to the X-rays

- (c) Longer to the X-rays
- 48. Which of the following is unit of absorbed dose? (a) Sievert
  - (b) Gray
- (c) Roentgen
- 49. In a radioactive phenomenon observation shown in figure where a deviates lesser than  $\beta$  in some electric or magnetic field (not shown in figure). What is the reason of less deviation of  $\alpha$ ?

(a)  $\alpha$  is charged particle

(b)  $\alpha$  is neutral particle

(c)  $\alpha$  is heavier particle

- (d) α is lighter particle
- 50. Which of the following effect is observed due to emission of  $\beta$ -during the phenomenon of radioactivity?
  - (a) A increase by 1 and Z remains same
- (b) Z increase by 1 and A remains same
- (c) Z decrease by 1 and A remains same
- (d) A decrease by 1 and Z remains same
